

BE HONEST

is this you?

claude writes
80 lines of code

you: scrolling
twitter / instagram

you: "looks good
to me 👍 "

3 weeks later
in production

swipe to meet your new accountability buddy →

THE REAL PROBLEM

80%

of AI-generated bugs are in code
the developer never read.

It's not that Claude writes bad code.
It's that **we stopped reading** what it writes.

Vibe coding is fun. Until it's
3am and production is on fire.

HOW IT WORKS

claude explains what it just wrote. automatically.

1

Claude writes non-obvious code : async logic, auth, silent failures, state mutations

2

vibecheck fires: plain English narration, no jargon, highlights the thing that'll bite you later

3

You actually understand what you shipped. Type "skip" anytime if you already get it.

EAL EXAMPLE

WITHOUT VIBECHECK

CLAUDE

wrote a function that deletes the user account and all associated data.

YOU

"looks good 👍"

data gone. no undo. user angry.

WITH VIBECHECK

VIBECHECK

This deletes the account **and all their data. Immediately. No soft delete, no recovery window.** Hope you meant that.

YOU

"oh wait, add a soft delete first 🤔"

crisis avoided. user stays.

CHECK

4

BUT WAIT.

"why not just ask Claude Code?"

you forget. every single time.
that's literally the whole problem.

vibecheck fires automatically.
no "hey can you explain this?" needed. it just happens.

it's a team standard.
one install. everyone on the team gets it. every session.

silent on obvious code.
only fires when something could actually bite you later.

CHECK

5

INSTALL NOW

stop shipping black boxes.

one command. works immediately.

```
claude plugins install github:Aaditya-git/claude-vibecheck
```

 free

 open source

 no config

 stays silent on trivial changes
